

AMENDMENTS TO THE SPECIFICATION

Please add the following abstract section to Page 16 the specification:

ABSTRACT

Central to this invention is the concept that motion of a display device controls an object viewer, where the object being viewed is typically essentially stationary in virtual space in the place surrounding the display device. Motion sensing of the display may be done by a variety of different approaches including motion sensors mounted on the display device as well as motion sensing derived by the interaction of multiple disparate wireless sensing sites.
